

ACOUSTIC PANELS COLLECTION

● What are acoustic panels ?

Soundproofing panels are wall panels made from a mixture of materials.

The Soundproofing panel is very well thought out.

In indoor environments, it effectively reduces noise disturbances.

It is a combination of wooden surface, black MDF, and polyester fiber.

This combination helps to dampen the transmission and reflection of sound, and it can be used in almost any indoor environment.

● Principles of Sound Absorption

Refraction/Scattering attenuation: When sound reaches the grille surface, it encounters interfaces with different acoustic impedances.

Resulting in scattered reflections that cause energy attenuation.

Thus absorbing and controlling sound.
